# Homicide Trends and Characteristics — Brazil, 1980–2002

Brazil is the largest and most populous country in South America (2002 population: approximately 175 million) (Brazilian Geography and Statistics Institute [BGSI], unpublished data, 2004). Although life expectancy in Brazil has increased and rates of infant mortality have decreased as a result of reductions in infectious disease mortality, homicide and other forms of injury-related mortality have increased as a proportion of overall mortality (1,2). Homicide is now the leading cause of death for persons aged 15-44 years. To describe trends and characteristics of homicides countrywide and in São Paulo city (2000 population: approximately 10.4 million) (BGSI, unpublished data, 2004), the State Health Department of São Paulo (SHDSP) analyzed vital statistics and census data for 1980-2002. This report summarizes the results of that analysis, which indicated that the homicide rate in Brazil more than doubled during this period (Figure 1). Since 2001, Brazilian authorities have implemented several initiatives to reduce the number of homicides, including a law that controls gun ownership and prohibits anyone other than police and members of the armed forces from carrying guns. However, homicides among adolescents and young adults remain a substantial public health problem in Brazil, and additional prevention strategies that target young persons are needed.

Data were obtained from the Mortality Information System operated by Brazil's Ministry of Health. This database includes information from death certificates for all states in Brazil. Additional data for São Paulo city were obtained from the Program for Quality Improvement of Mortality Information. Homicide was defined as a death resulting from an injury that was inflicted purposefully by another (including legal intervention) for which the underlying cause listed on the death certificate corresponds to codes E960–E978 and E970–E978 of the *International Classification of Diseases, Ninth Revision* for 1980–1996, and codes X85–Y09 and Y35 of the FIGURE 1. Homicide rates\*, by year — Brazil and São Paulo city, 1980–2002

\* Per 100,000 population.

*Tenth Revision* for 1997–2002. Population data for Brazil and São Paulo city were obtained from BGSI. Crude, age-, and sex-specific rates were calculated per 100,000 population. To examine the association between socioeconomic status and homicide rates in São Paulo city, SHDSP obtained data on the monthly average income of heads of households in all 96 city districts from the 2000 Brazil Population Census. Pearson correlation analysis was used to test this association.

Patsy A. Hall Pearl C. Sharp During 1980–2002, the homicide rate in Brazil more than doubled, from 11.4 per 100,000 population to 28.4. In São Paulo city, the rate more than tripled, from 17.5 in 1980 to 53.9 in 2002 (Figure 1). In 2002, a total of 49,570 homicides were documented in Brazil. Firearms and sharp objects were the weapons used in 34,085 (68.8%) and 6,728 (13.6%) of all incidents, respectively. In 2002, the homicide rate was 53.1 among males and 4.3 among females, and adolescent (aged 15–19 years) and young adult (aged 20–29 years) males accounted for 52.2% of homicide victims. By age group, the homicide rate was highest among young adult males (121.0).

In 2002, a total of 5,719 homicides occurred in São Paulo city. Firearms and sharp objects were used in 62.0% and 4.7% of all incidents, respectively. The homicide rate for males (105.1 per 100,000 population) was nearly 15 times that for females (7.2). Adolescent and young adult males accounted for the largest proportion (59.8%) of homicide victims, and agespecific homicide rates were highest among males aged 20–29 years (227.4) (Figure 2). The risk for homicide varied substantially by city district. In 2002, crude homicide rates ranged from 1.2 in the Jardim Paulista District to 115.8 in the Guaianazes District. In some districts, homicide rates for males aged 15–29 years were >400. A negative correlation was observed between the average monthly income of heads of households and homicide rates in these districts (Pearson correlation coefficient = -0.58; p<0.05).

**Reported by:** VP Gawryszewski, PhD, Research Institutes Coordination, State Health Dept of São Paulo, Brazil. JA Mercy, PhD, Div of Violence Prevention, National Center for Injury Prevention and Control, CDC.

Editorial Note: The findings in this report indicate that homicide rates in Brazil and São Paulo city increased

FIGURE 2. Homicides rates\* among males, by age group — Brazil and São Paulo city, 2002

\* Per 100,000 population.

markedly during 1980–2002. Other countries in the Americas have experienced similar increases in homicide rates during this period (3). In 2002, Brazil had one of the world's highest homicide rates, nearly four times higher than that for the United States (4). In 2000, Brazil accounted for an estimated 28% of all the homicides that occurred in the Americas, a region that has the highest homicide rate (4).

Factors that might have contributed to increased violence include increasing urbanization, expansion of illegal drug and firearms trafficking, a lengthy economic crisis, increased unemployment, and widening income inequality (5-7). The strong negative correlation between monthly average income and homicide rates in São Paulo city described in this report is consistent with homicide research in other urban areas worldwide (8). Further research is needed to better understand the association between violence and poverty so appropriate interventions can be developed. This association might be attributed to income inequality and disparities in job and education prospects.

Brazil has adopted measures to reduce the number of homicides. In 2001, the Brazil Ministry of Health issued a national policy to reduce injury-related morbidity and mortality and, in 2002, Brazil issued guidelines for the reporting of child maltreatment by health professionals. In December 2003, the Brazilian Congress passed a law that controls gun ownership and prohibits anyone other than police and members of the armed forces from carrying guns. The law also established tougher penalties for international firearms trafficking. The country also plans to implement an emergency department– based registry for injuries. In 2002, the government of São Paulo state passed legislation to establish an injury surveillance system. Improved surveillance data can help guide program and policy design and monitor progress toward reducing levels of violence (4).

Several violence-prevention initiatives have been developed in Brazil. In Rio de Janeiro, Viva Rio, a nongovernment organization, directs projects for 1) promoting awareness about the risks of using or carrying firearms, 2) reducing firearm injuries, 3) promoting peace, and 4) providing vocational training for youths who live in impoverished communities. In São Paulo state, a coalition of private sector investor groups, state banking organizations, advertising and media companies, and research centers established the São Paulo Institute Against Violence to support projects for violence prevention. In addition, the local government of São Paulo city implemented the Renda Minima Program, which provides financial support to low-income families, and the Bolsa Trabalho Program, which promotes youth employment; both programs might help reduce the homicide rate. The impact of these efforts should be evaluated to guide development of interventions in other communities.

The findings in this report are subject to at least two limitations. First, data from death certificates might underestimate the proportion of firearm-related homicides. Studies based on medical examiners' records have documented that, in large Brazilian cities like Recife, >90% of homicides involve firearms, whereas death certificates indicate that <70% of deaths were firearm related (9). Second, information is lacking about perpetrator characteristics or circumstances of these deaths (e.g., place of occurrence, relationship between victim and offender, and the use of alcohol and other substances). A homicide surveillance system is being planned for São Paulo city that will link information from death certificates with medical examiner and police records to guide public policies.

Homicides among adolescents and young adults constitute a substantial public health problem in Brazil, and additional prevention strategies that target young persons are needed. These strategies should include partnerships among the government, universities, the private sector, nongovernment organizations, and communities.

# Hypothermia-Related Deaths — United States, 2003

Hypothermia, a preventable lowering of the core body temperature to <95° F (<35° C) (1), causes approximately 600 deaths each year in the United States (2). Exposure to excessive cold (or excessive exposure to cold) slows enzymatic activity throughout the body, leading to potentially fatal rhabdomyolysis, coagulopathy, renal failure, and dysrhythmias (3). Alcohol intake, activity level, and type of clothing are among the modifiable factors associated with hypothermia (4). Understanding the epidemiology and pathophysiology of hypothermia is important to preventing hypothermiarelated mortality. This report describes three cases of fatal hypothermia that occurred during 2003, reviews national statistics on mortality from cold exposure in 2001, and provides recommendations for the diagnosis, treatment, and prevention of hypothermia. Public health strategies tailored to U.S. populations at increased risk for exposure to excessive cold can help reduce mortality and morbidity from hypothermia.

# **Case Reports**

**Case 1.** In the fall of 2003, a man aged 44 years was found dead outdoors in Vermont. He wore a T-shirt, long-sleeved shirt, two sweatshirts, underpants, pants, socks, and boots. His clothes were wet, and an empty vodka bottle was nearby. Local investigators reported that he looked as though he "lay down and went to sleep." Overnight, the temperature had dropped to <32° F (<0° C). Autopsy findings were unremarkable except for a fatty liver. A toxicology screen was negative except for an elevated blood alcohol concentration (BAC) of 0.30 g/dL, nearly four times the legal intoxication limit of 0.08 g/dL in Vermont. Cause of death was certified as hypothermia, with alcohol intoxication as a contributing factor.

**Case 2.** In the spring of 2003, a man aged 76 years with Alzheimer's disease was reported missing from his home in Vermont. The next day, a farmer found the man lying in a swampy area where his car had become stuck in the mud. Overnight, the temperature had dropped to  $<32^{\circ}$  F ( $<0^{\circ}$  C). The man was pronounced dead at the scene; cause of death was hypothermia precipitated by a cold, wet environment.

**Case 3.** In the fall of 2003, Alaska state troopers reported that a hiker aged 35 years was found dead alongside a highway. The hiker was not clothed from the waist up and was missing a shoe. The overnight temperature was 44° F ( $6.7^{\circ}$  C), but conditions were wet and windy. The hiker's BAC was 0.28 g/dL, nearly four times the legal intoxication limit of 0.08 g/dL in Alaska; his toxicology screen was positive for

cocaine and marijuana. Cause of death was hypothermia, with drug and alcohol intoxication as contributing factors.

# **United States**

In the United States, certain populations (e.g., alcoholics; drug users; elderly, homeless, and chronically ill persons; and those with preexisting heart disease) are at increased risk for dying from hypothermia. During 2001, a total of 599 persons in the United States (2) died from "exposure to excessive natural cold" (code X31), as categorized in the *International Classification of Diseases, Tenth Revision*. Of these victims, 67% were male, and 51% were aged >65 years. As persons age, their risk for dying from hypothermia increases (Figure). Approximately 71% of the hypothermia-related deaths in 2001 occurred during November–February. The three states with the highest rates of death from hypothermia were Montana (1.44 persons per 100,000 population), Alaska (1.42), and New Mexico (1.04).

**Reported by:** S Shapiro, MD, P Morrow, MD, Vermont Dept of Health. F Fallico, MD, Alaska Dept of Health and Social Svcs. E Azziz Baumgartner, MD, EIS Officer, CDC.

**Editorial Note:** Hypothermia causes multiple dysfunctions, including cardiac arrhythmias, renal insufficiency, and hemo-concentration. In late stages of hypothermia, brain function

\* Per 100,000 population.

deteriorates, predisposing persons to poor judgment and increasing their risk for further exposure to excessive cold.

Improper clothing and comorbidities can interfere with the balance between the body's heat production and cooling. Wet clothing cannot retain body heat; warm clothing keeps the body dry and helps to decrease heat loss, which can save a person's life during excessively cold weather. Advanced age, immobility, and existing medical conditions can increase the risk for hypothermia and death during cold weather. Certain medical conditions (e.g., hypothyroidism, congestive heart failure, and diabetes) can affect a person's ability to recognize warning symptoms of hypothermia, compensate for the cold, or to seek shelter from the cold.

Use of alcohol or other mood-altering drugs often is associated with cases of hypothermia. The vasodilatation caused by alcohol provides a sensation of warmth but also increases heat loss through radiation. In addition, alcohol and other drugs impair hand coordination, mobility, and decision-making abilities.

Treatment of hypothermia focuses on returning the core body temperature to normal while providing supportive care. The method chosen to rewarm a patient depends on the severity of the hypothermia (Box). With rewarming and supportive care, even persons who appear to be dead might survive hypothermia (5).

Prevention of hypothermia requires public health strategies that target persons at greatest risk. Such strategies can include creating community programs for checking on the well-being of elderly persons, opening temporary shelters for the homeless, and urging persons with cardiovascular disease to avoid outdoor exercise during cold weather (6).

# BOX. Epidemiology, diagnosis, treatment, prevention, and reporting of hypothermia

#### Epidemiology

- Hypothermia is caused by exposure to excessive cold (or excessive exposure to cold).
- Hypothermia can occur in temperatures above freezing.
- Hypothermia disproportionately affects the elderly, homeless, and chronically ill, and persons with preexisting heart disease.
- Immersion in water, wearing wet clothing, and exposure to wind can accelerate body heat loss.
- Mood-altering substances (e.g., alcohol and drugs) impair judgment and are associated with mortality from hypothermia.

## **Clinical findings**

- Symptoms of hypothermia include sensation of cold, exhaustion, and numbness.
- Signs of hypothermia include shivering, pallor in adults, flushed skin in children, decreased hand coordination, confusion, and slurred speech.
- Diagnosis is made when the core body temperature is <95.0° F (<35.0° C).
- Hypothermia can be mild (90.0° F-<95.0° F [32.2° C-<35.0° C]), moderate (82.5° F-90.0° F [28.0° C-32.2° C]), or severe (<82.5° F [<28.0° C]).</li>

## Treatment

- Mild hypothermia can be treated with passive rewarming by using blankets.
- Moderate hypothermia requires active rewarming with warm intravenous fluids, oxygen, lavage, or immersion baths.
- Severe hypothermia might require both active rewarming and cardiopulmonary bypass.
- The core body temperature should be rewarmed by  $2-4^{\circ}$  F (1-2° C) per hour.
- As needed, cardiopulmonary resuscitation and supportive care should be provided, cardiac rhythm monitored, and electrolytes replenished.

## Prevention and reporting

- The public should be educated about the danger of using alcohol and drugs in excessive cold.
- During cold weather, infants, elderly neighbors, and homeless populations should be monitored.
- Instructions should be provided on how to prepare emergency kits for homes and cars and how to safely use an alternate heat source (http://www.cdc.gov/nceh/hsb/ extremecold).
- Any cases of hypothermia should be reported to the local health department.

# Alcohol Use Among Adolescents and Adults — New Hampshire, 1991–2003

Alcohol abuse is the third leading preventable cause of death in the United States (1). Because binge and heavy drinking increase the risk for cirrhosis, cancer, heart disease, stroke, injury, and depression (2,3), public health efforts have focused on reducing these patterns of alcohol use. The Council of State and Territorial Epidemiologists, the Association of State and Territorial Chronic Disease Program Directors, and CDC developed Indicators for Chronic Disease Surveillance (4), which provides a standard set of measures for alcohol surveillance. The New Hampshire Department of Health and Human Services used these measures to facilitate statewide trend analysis of alcohol use among adolescents and adults. This report summarizes the results of that analysis, which indicated that, in 2003, a total of 30.6% of adolescents reported binge drinking. In 2001, a total of 15.8% of adults reported binge drinking, and 6.3% reported heavy drinking. Interventions are needed to prevent adolescent drinking and to reduce excessive alcohol use among adults.

Three data sources were used to examine trends in alcohol use: New Hampshire (NH) Youth Risk Behavior Survey (NHYRBS), NH Behavioral Risk Factor Surveillance System (NHBRFSS), and NH Vital Records (NHVR). NHYRBS is a biennial, self-administered, school-based survey of students in grades 9-12; NHYRBS was conducted in odd-numbered years during 1995–2003. Because the statewide response rate was <60% during 1997-2001, analysis of NHYRBS data was restricted to 1995 and 2003 (response rate: 65% and 62%, respectively). NHBRFSS is an annual population-based, random-digit-dialed telephone survey of the noninstitutionalized, civilian population aged ≥18 years. Alcohol-related questions were asked annually during 1991-1993 and in odd-numbered years during 1995-2001 (response rate: 42.5%-70.9%). NHVR maintains and analyzes death-related data that are reported according to state law. The cause of death reported is the underlying cause of death or the specific disease, condition, or injury that leads to death.

For this analysis, seven public health indicators of alcoholrelated impact were assessed: binge drinking among adults, women of child-bearing age (i.e., aged 18-44 years), and adolescents (indicators 1-3); heavy drinking among adult men and women (indicators 4-5); alcohol use among adolescents (indicator 6); and mortality from chronic liver disease (indicator 7). Binge drinking was defined as having five or more drinks on one or more occasions during the 30 days preceding the survey. Heavy drinking was defined as an average daily consumption of greater than two drinks for men and one drink for women. Alcohol use among adolescents was defined as having one or more drinks during the 30 days preceding the survey. Mortality from chronic liver disease was determined by using the underlying primary cause of death from International Classification of Diseases, Tenth Revision codes K70 or K73-K74 or, for years before 1999, Ninth Revision code 571. Age-standardized prevalence estimates were calculated by using the 2000 U.S. standard population for all indicators except those that were age specific.

In the 2003 NHYRBS, 47.1% of high school students reported alcohol use, and 30.6% reported binge drinking; in comparison with 1995 results, changes were not statistically significant (Table 1). Both alcohol use and binge drinking among students increased significantly in grades 9 and 12 in 1995 and 2003.

In the 2001 NHBRFSS, 15.8% of adults reported binge drinking. During 1991–2001, men were two to three times more likely than women to report binge drinking (Table 2). In 2001, women of child-bearing age were six times more likely to report binge drinking than women aged  $\geq$ 45 years (14.2% [95% confidence interval (CI) = 11.8%–16.6%] versus 2.3% [95% CI = 1.4%–3.2%]). In 2001, a total of 6.3% of adults reported heavy drinking (Table 3). No statistically significant differences were observed in heavy drinking between men and women during 1991–2001.

According to the 2001 NHVR, 9.7 deaths per 100,000 New Hampshire residents were attributable to chronic liver disease.

Confidence interval.

In 2001, males were significantly more likely than females to die from chronic liver disease (14.6 [95% CI = 11.5-17.8] versus 5.3 [95% CI = 3.6-7.1]). During 1991-2001, trends in mortality from chronic liver disease remained stable.

Reported by: A Redmond, MPH, J Horne, A Pelletier, MD, J Porter, MPH, New Hampshire Dept of Health and Human Svcs; J Johnson, MA, V St. Martin, MAT, New Hampshire Dept of Education. R Brewer, MD, J Miller, MD, Div of Adult and Community Health, National Center for Chronic Disease Prevention and Health Promotion, CDC.

Editorial Note: The findings in this report indicate that adolescents and adults in New Hampshire use alcohol in ways that place them at increased risk for alcohol-related health problems. New Hampshire is the only state in the northeast with no alcoholic beverage sales tax, which contributes to low alcohol prices and the highest per-capita alcohol sales in the United States (5). Compliance checks of New Hampshire alcohol vendors indicate that approximately 30% of attempts to purchase alcohol by adolescents are successful (6).

The findings in this report are subject to at least four limitations. First, because approximately half of all adults and high school students reported no alcohol use, the prevalence of binge drinking among current drinkers was underestimated. Second, a trend analysis of alcohol use among high school students could not be performed because weighted data from NHYRBS during 1997-2001 were unavailable. Third, analysis of annual data at the substate level was not possible because of sample size limitations. Finally, the full burden of alcohol-related disease and death, including injuries, violence, and other health impacts, could not be determined because analysis of alcohol-related health effects was limited to deaths caused by chronic liver disease.

New Hampshire was one of 12 states that included a module on binge drinking in its 2003 BRFSS survey, which will provide more recent and comprehensive information on adult binge drinking, including the type and quantity of alcohol consumed, the location of consumption, and alcohol-impaired driving that might have resulted from binge drinking. Alcohol surveillance information in New Hampshire was published for the first time in 2003 (6); the report will be updated annually to help policymakers and public health authorities implement programs to prevent adolescent drinking and excessive alcohol use among adults.

## Brief Report

# Exposure to Tear Gas from a Theft-Deterrent Device on a Safe — Wisconsin, December 2003

On December 4, 2003, a hazardous materials (HazMat) release occurred at a jewelry store in Beloit, Wisconsin, when the store owner tightened a screw on the door of an old safe outfitted with a chemical theft-deterrent device. The device included a metal housing containing a glass vial of liquid, which cracked as the screw tightened, releasing approximately 4 ounces of tear gas. The store owner sustained eye and skin irritation and was treated at a hospital and released. Twelve persons in the building and persons in adjacent businesses were evacuated for 3 hours while a certified Level A HazMat team\*, city firefighters, and emergency medical technicians responded to the release. This report summarizes the response to this event and underscores the need for persons who use old safes and vaults to know how to identify these devices and avoid tampering with them.

Beginning in the 1920s, certain safes and vaults included (or were fitted with) theft-deterrent devices containing chemical vials (Figure). Chloropicrin<sup>†</sup> was used commonly in these devices. Other tear gas agents reportedly were used in similar theft-deterrent devices. The metal casing of these devices usually is approximately 3 inches wide and 6–8 inches tall; the device is fastened to the back of a safe door with screws. A major manufacturer of these devices was located in Wisconsin during the 1920s–1950s, and other companies sold similar devices. One such device was found in an Iowa bank in 1999 after a vial shattered, releasing chloropicrin and causing a pregnant bank employee to suffer eye, skin, and throat irritation (2). The number of these devices sold or still in circulation is unknown.

Chloropicrin was used as a chemical weapon during World War I (2). Documented symptoms of chloropicrin exposure include 1) irritation of the eyes, skin, and respiratory system; 2) lacrimation (i.e., tearing); 3) cough; 4) pulmonary edema; and 5) nausea and vomiting (1).

The 2003 chloropicrin release was reported to the Hazardous Substances Emergency Events Surveillance (HSEES) system operated by the Wisconsin Department of Health and Family Services. Created and funded by the Agency for Toxic

#### FIGURE. Chemical theft-deterrent device used on a safe

Substances and Disease Registry (3), HSEES is a multistate<sup>§</sup> health department surveillance system that tracks morbidity and mortality resulting from events<sup>¶</sup> involving the release or potential release of a hazardous substance<sup>\*\*</sup>. However, because reporting HazMat events to HSEES is not mandatory, participating state health departments might not be informed about every event. In addition, how many chemical releases from theft-deterrent devices occur in nonparticipating states is unknown.

Persons who use or are around older safes and vaults (e.g., bankers, jewelers, locksmiths, and vault technicians) should know how to identify these devices and should avoid tampering with them. If a device is identified, only trained persons (e.g., experienced locksmiths or HazMat personnel) should attempt to remove or neutralize these devices. In addition, appropriate personal protective equipment should be used when attempting to dismantle these devices (4). If the contents of a device are released, the area should be evacuated immediately. Persons who have adverse health effects (e.g., eye, skin, or respiratory irritation) should seek medical attention immediately.

<sup>\*</sup> Equipped typically with supplied-air respirator, pressure-demand, and selfcontained breathing apparatus; fully encapsulating chemical-resistant suit; coveralls; long cotton underwear; chemical-resistant gloves (inner); chemicalresistant boots with steel toe and shank; hard hat; disposable gloves and boot covers; cooling unit; and two-way radio communications.

<sup>&</sup>lt;sup>†</sup> Also called nitrochloroform, nitrotrichloromethane, and trichloronitromethane. The chemical abstracts service number is 76-06-2 (1).

<sup>&</sup>lt;sup>§</sup> Alabama, Colorado, Iowa, Louisiana, Minnesota, Mississippi, Missouri, New Jersey, New York, North Carolina, Oregon, Texas, Utah, Washington, and Wisconsin.

<sup>&</sup>lt;sup>9</sup> An event is the release or threatened release of a hazardous substance(s) in an amount requiring removal, cleaning up, or neutralizing according to federal, state, or local law (3).

<sup>\*\*</sup> A substance that can reasonably be expected to cause an adverse health effect.

## Notice to Readers

# Updated Recommendations on the Use of Pneumococcal Conjugate Vaccine: Suspension of Recommendation for Third and Fourth Dose

On March 2, this notice was posted on the MMWR website (http://www.cdc.gov/mmwr).

On February 13, 2004, CDC recommended that healthcare providers temporarily suspend routine use of the fourth dose of 7-valent pneumococcal conjugate vaccine (PCV7) when vaccinating healthy children (1). This action was taken to conserve vaccine and minimize the likelihood of shortages until Wyeth Vaccines, the only U.S. supplier of PCV7 (marketed as Prevnar<sup>®</sup>), restores sufficient production capacity to meet the national need. Since that recommendation, PCV7 production has been much less than expected because of continuing problems with the PCV7 vial-filling production line. Shipments have been delayed, resulting in spot shortages that might continue beyond summer 2004 and become widespread. Effective immediately, to further conserve vaccine, CDC recommends that all health-care providers temporarily suspend routine administration of both the third and fourth doses to healthy children.

Approximately 1.3 million doses of PCV7 are needed each month to provide every infant in the United States with the full, 4-dose vaccination series. For January–April 2004, total shipments are estimated to be  $\leq$ 55% of the amount needed. Limiting healthy children to 2 doses of PCV7 will conserve vaccine and permit more children to receive at least 2 doses. More vaccine is expected to become available for distribution in May and June, but availability cannot be guaranteed. CDC will continue to update health-care providers on the status of vaccine supplies while the shortage persists.

PCV7 is highly effective. The routinely recommended 4-dose series has been 97% (95% confidence interval [CI] = 76%-100%) effective against invasive disease caused by serotypes represented in the vaccine; effectiveness in children who received 3 doses before age 1 year has been 87% (95% CI = 71%-94%), and effectiveness in children who received 2 doses has been 94% (95% CI = 84%-98%) (CDC, unpublished data, 2004). Efficacy data from a randomized, controlled trial suggest that 1-2 doses of pneumococcal conjugate vaccine are protective during the 2-month interval before the next dose, with 86% effectiveness (but a 95% CI that includes zero) (2). Although limited data support a 2-dose schedule among infants, this regimen is preferable to vaccinating certain children with 3 doses and not vaccinating others. Because PCV7 is a new vaccine, no long-term data on vaccine effectiveness are available. However, the incidence of invasive pneumococcal disease declines rapidly after age 2 years, even in unvaccinated children. In 1998, before PCV7 was licensed, the incidence of invasive disease was 203 per 100,000 infants aged 1 year and 63 per 100,000 children aged 2 years (3).

To ensure that every child is protected against pneumococcal disease despite the PCV7 shortage, CDC, in consultation with the American Academy of Family Physicians, the American Academy of Pediatrics, and the Advisory Committee on Immunization Practices, recommends that all health-care providers temporarily discontinue administering the third and fourth dose of PCV7 to healthy children. Health-care providers should continue to administer the routine 4-dose series to children at increased risk for severe disease<sup>\*</sup>. Unvaccinated, healthy children aged 12–23 months should receive a single dose of PCV7. For children aged  $\geq 2$  years, PCV7 is not recommended routinely.

This recommendation reflects CDC's assessment of the existing national PCV7 supply and will be changed if the supply changes. Updated information about the national PCV7 supply is available from CDC at http://www.cdc.gov/nip/ news/shortages/default.htm.

<sup>\*</sup> Including children with sickle cell disease and other hemoglobinopathies, anatomic asplenia, chronic diseases (e.g., chronic cardiac and pulmonary disease and diabetes), cerebrospinal fluid leak, human immunodeficiency virus infection and other immunocompromising conditions, immunosuppressive chemotherapy or long-term systemic corticosteroid use; children who have undergone solid organ transplantation, and children who either have received or will receive cochlear implants (4). All these children have been identified as being at either "high risk" or "presumed high risk" for severe invasive pneumoccocal disease (5).

Health-care providers should maintain lists of children for whom conjugate vaccine has been deferred so it can be administered when the supply allows. The highest priority for vaccination among children who have been deferred is children vaccinated with  $\leq 2$  doses who are aged <1 year.

Because data on the long-term efficacy of 3-dose or 2-dose vaccine regimens are limited, health-care providers should consider the diagnosis of invasive pneumococcal disease in incompletely vaccinated children and are encouraged to report invasive pneumococcal disease after any regimen of pneumococcal conjugate vaccine to CDC through state health departments. If a pneumococcal isolate is available from a vaccinated child, CDC will perform serotyping to determine whether the type is included in the vaccine. Additional information is available from CDC at http://www.cdc.gov/nip/home-hcp.htm and by telephone, 404-639-2215 or fax, 404-639-3970.

# **Satellite Broadcast on HIV Prevention**

CDC and the Public Health Training Network will present a satellite broadcast and webcast, "Prevention with Positives: HIV Risk Reduction Strategies for Health Care Providers," on Thursday, April 29, 2004, beginning at 1 p.m., EDT. The 2-hour forum will discuss evidence-based behavioral interventions and ongoing research about HIV prevention with persons living with HIV (PLWH), describe examples of behavior interventions for PLWH in community-based organizations and clinical settings, and identify opportunities and methods for health-care providers to link PLWH to local HIV-prevention resources. A panel of experts will address viewers' questions, which can be sent via fax before, during, and after the program.

Additional information and instructions for continuing education are available at http://www.cdcnpin.org/broadcast and through the CDC Fax Information System, telephone 888-232-3299, by entering document number 130039 and a return fax number. Organizations are responsible for setting up their own viewing sites and are encouraged to register their sites as soon as possible so persons who want to view the broadcast can access information online. Directions for establishing and registering a viewing site are available on the website. The broadcast also can be viewed live or later on computers with Internet and RealPlayer<sup>®</sup> capability through a link at http://www.phppo.cdc.gov/phtn. Videotapes and CD-ROMs of the broadcast can be ordered by telephone, 800-458-5231.

U: Unavailable. -: No reported cases.

\* Mortality data in this table are voluntarily reported from 122 cities in the United States, most of which have populations of >100,000. A death is reported by the place of its

<sup>1</sup> Total includes unknown ages.

The Morbidity and Mortality Weekly Report (MMWR) Series is prepared by the Centers for Disease Control and Prevention (CDC) and is available free of charge in electronic format and on a paid subscription basis for paper copy. To receive an electronic copy each week, send an e-mail message to *listserv@listserv.cdc.gov*. The body content should read *SUBscribe mmwr-toc*. Electronic copy also is available from CDC's World-Wide Web server at http://www.cdc.gov/mmwr or from CDC's file transfer protocol server at *ftp://ftp.cdc.gov/pub/publications/mmwr*. To subscribe for paper copy, contact Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402; telephone 202-512-1800.

Data in the weekly *MMWR* are provisional, based on weekly reports to CDC by state health departments. The reporting week concludes at close of business on Friday; compiled data on a national basis are officially released to the public on the following Friday. Address inquiries about the *MMWR* Series, including material to be considered for publication, to Editor, *MMWR* Series, Mailstop C-08, CDC, 1600 Clifton Rd., N.E., Atlanta, GA 30333; telephone 888-232-3228.

All material in the MMWR Series is in the public domain and may be used and reprinted without permission; citation as to source, however, is appreciated.

All MMWR references are available on the Internet at http://www.cdc.gov/mmwr. Use the search function to find specific articles.

Use of trade names and commercial sources is for identification only and does not imply endorsement by the U.S. Department of Health and Human Services.

References to non-CDC sites on the Internet are provided as a service to *MMWR* readers and do not constitute or imply endorsement of these organizations or their programs by CDC or the U.S. Department of Health and Human Services. CDC is not responsible for the content of these sites. URL addresses listed in *MMWR* were current as of the date of publication.
